Product Requirements Document(PRD)

Product Overview

Product Name: Geopulse

Product Type: AI Visibility Platform (SaaS)

Description: Geopulse is an AI visibility tracking platform that enables brands to monitor, analyze, and optimize how they appear in AI-generated responses across major AI engines including ChatGPT, Google Gemini, and Google AI Overviews. The platform provides actionable insights into brand mentions, competitor positioning, and source attribution in AI-generated content.

Problem Statement

As AI-powered search and conversational interfaces become primary information discovery channels, brands lack visibility into how they are represented in AI-generated answers. Traditional SEO tools do not track AI engine responses, leaving businesses blind to:

- Whether their brand is being mentioned in relevant AI responses
- How they rank against competitors in AI-generated recommendations
- Which sources AI models cite when discussing their industry
- The sentiment and context of their brand mentions in AI outputs

Target Users

Primary Users:

- Marketing teams at SaaS companies

- Brand managers and digital strategists
- SEO and content marketing professionals
- Competitive intelligence analysts

Company Profile (Example):

- B2B SaaS companies (e.g., project management tools like Momentum)
- Companies in competitive markets where AI recommendations influence purchasing decisions

Product Goals

1. Provide real-time visibility into brand presence across major AI engines
2. Enable competitive benchmarking in AI-generated responses
3. Identify optimization opportunities through source and citation analysis
4. Surface actionable insights through aggregated analytics and trend tracking

5. Core Functional Requirements

5.1 Visibility Dashboard

Goal: Show the user exactly how often their brand appears in AI responses and how that is changing over time.

- **Global Visibility Score:** The system will calculate a single percentage score (0-100%) that represents how often the user's brand is mentioned across all active prompts. This serves as the primary "health check" metric.
- **Trend Tracking:** The dashboard will plot the user's Visibility Score and Average Position on a timeline graph. This graph must support multiple lines to allow direct comparison against top competitors on the same specific days.

- **Smart Filters:** Users can slice all data (charts and scores) by:
  - **Time:** Last 7, 30, or 90 days.
  - **AI Model:** See how ChatGPT differs from Gemini or Google AI Overviews.
  - **Region:** Filter results based on the country where the prompt was simulated (e.g., US vs. UK).
- **Live Mention Feed:** A real-time list of the most recent AI conversations where the brand was found. This provides immediate proof to back up the data.

5.2 Prompt & Topic Management

Goal: Help users define, organize, and analyze the specific questions their customers are asking AI models.

- **Topic-Based Organization:** Users can group individual questions (Prompts) into broader categories (Topics). For example, the topic "Pricing" might contain prompts like "How much does X cost?" and "Is X expensive?".
- **AI Prompt Generator:** To solve the "blank page" problem, the system will use AI to suggest relevant questions based on a user's topic. These enter a "Suggested" list for review before they are tracked.
- **Single Prompt Analytics:** Users can click into any individual prompt to see:
  - **Rank:** Where the brand appears in the list (1st, 2nd, etc.).
  - **Chat Evidence:** A view of the actual raw text from the AI response, with the user's brand name highlighted in green and competitors in gray.
  - **History:** A log of how the AI's answer to this specific question has changed over time.

5.3 Source & Citation Analysis

Goal: Reveal *where* the AI models are finding information, so users know which websites to update or pitch.

- **URL Extraction:** The system will scan every AI response and extract all links (citations) and reference sources.

- **Gap Analysis:** A critical feature that filters for "Missed Opportunities." It identifies websites that are cited for competitors but *not* for the user.
- **Domain Aggregation:** The system will group individual URL citations by their root domain (e.g., grouping 5 different *Forbes* articles under "Forbes.com") to show which publishers have the most influence on the AI.

5.4 Competitor Intelligence

Goal: Automate the tracking of market rivals.

- **Auto-Discovery:** The system will automatically suggest competitors by analyzing who else frequently appears in the responses for the user's tracked prompts.
- **Share of Voice:** A direct comparison metric showing how much "airtime" the user gets compared to their selected competitors.

5.5 Company & Brand Settings

Goal: Ensure the system accurately recognizes the brand.

- **Smart Matching:** Users can define a "Tracked Name" (strict match) and "Aliases" (e.g., "HubSpot" vs. "HubSpot CRM") to ensure the system counts every mention, even if the spelling varies.
- **Domain Mapping:** Links the company’s website to their profile to track when they are cited as a source.

Data Model (Conceptual)

Company

- Display name, tracked name, aliases[], domain

Competitor

- Display name, tracked name, aliases[], domain, color (for logo)

Topic

- Name, status (active/suggested), prompts[]

Prompt

- Text, topic, country, status (active/suggested), suggested_at

Chat (AI Response)

- Model (ChatGPT/Gemini/Google AI), prompt, response_text, mentioned_competitors[], sources[], position, created_at

Source

- URL, title, domain, mentioned (boolean), mentioned_competitors[], used_total

---

AI Models Supported

1. **ChatGPT** (OpenAI)
2. **Gemini** (Google)
3. **Google AI Overview** (Search Generative Experience)

Key Metrics Tracked

- **Visibility (%):** Percentage of AI responses that mention the brand for tracked prompts
- **Position:** Average ranking position when mentioned (lower is better)
- **Mentions:** Which competitors appear in responses
- **Sources/Citations:** Which URLs AI models cite as sources
- **Trend Indicators:** Percentage/decimal change over selected timeframe

---

Success Metrics

1. User can identify visibility gaps within 30 seconds of viewing dashboard
2. Users can track new competitors in under 60 seconds
3. Users can trace specific AI mentions back to source citations
4. Dashboard provides actionable competitive intelligence without requiring manual AI queries

---

Assumptions & Dependencies

Assumptions:

- Users have identified target prompts/queries relevant to their industry
- AI model APIs provide consistent response formats for parsing
- Competitors have publicly identifiable brand names

Dependencies:

- Access to ChatGPT, Gemini, and Google AI Overview APIs or scraping infrastructure
- Natural language processing for mention detection and sentiment analysis
- Scheduled crawling infrastructure for continuous monitoring
